# HostMyCalls™

## Essential Internet Service

Cloud and hosted applications have made the Internet a mission-critical service to almost every organization. Many Internet services are unreliable which often cause disruption to business processes each time they go down. Other Internet services suffer from packet loss making them unsuitable for real time applications such as VoIP. More reliable Internet connections may be cost prohibitive, too slow or unavailable.
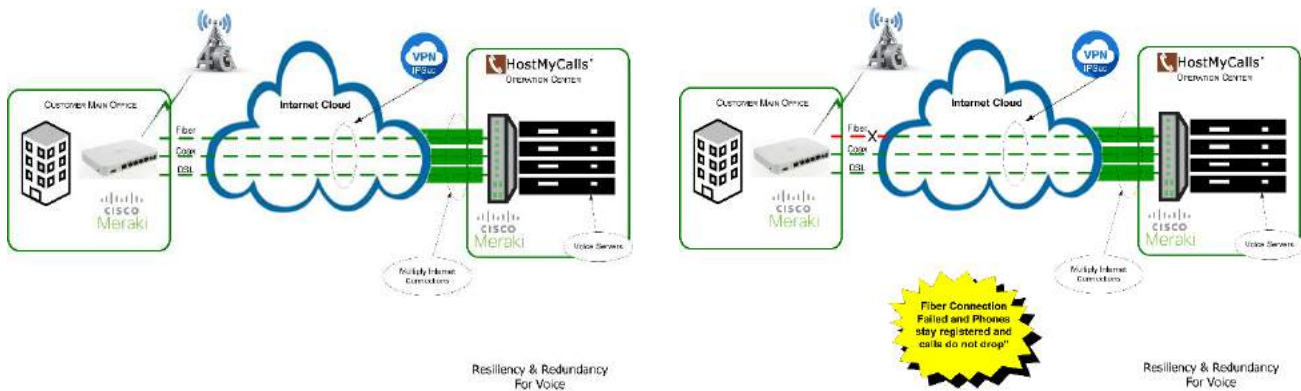

### Cisco Meraki

## Essential Internet Service

**CISCO Meraki**

HostMyCalls offer a Software Defined Wide Area Network (SD-WAN) solution using Cisco Meraki MX Series routers. Our SD-WAN capability allows customers with 2 Internet connections to have a redundant and resilient link to our service. Both Internet connections can be used simultaneously for voice traffic. Should one of the connections fail, all voice traffic is immediately shifted to the other Internet connection preventing any calls from dropping.

**Next-Gen Firewall** – The Meraki MX Routers provide a sophisticated firewall capable of blocking application types such as Gaming, Social Networks, Sports and File Sharing. It can also block specific applications such as Facebook, Snapchat and Twitter preventing employees from abusing company resources and their time.

**HostMyCalls Essential Internet Service can provide your business with the voice and network security today's world demands.**
